## Problem Set 6

### Question 1

Prove that if  $f(x)$  is differentiable at  $a$ , then it is continuous at  $a$ .

**Proof:**

Suppose  $f(x)$  is differentiable at  $a$ . Then,  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} = L$  and  $f(a)$  exist. Since  $h$  is constant  $\lim_{h \rightarrow 0} h$  exist. Then,

$$\begin{aligned} \lim_{h \rightarrow 0} h \cdot \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} &= \lim_{h \rightarrow 0} h \cdot L \\ &= 0 \cdot L \\ &= 0 \\ &= \lim_{h \rightarrow 0} (f(a+h) - f(a)) \end{aligned}$$

Then we know  $\lim_{h \rightarrow 0} f(a+h) = \lim_{h \rightarrow 0} f(a)$ . Thus,  $\lim_{x \rightarrow a} f(x) = f(a)$ .

### Question 2

Prove if  $\forall x, f(x) = c, c \in \mathbb{R}$ , then  $\forall a : f'(a) = 0$ .

**Proof:**

Suppose  $a$  is any number, then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$ .

$$\begin{aligned} \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} &= \lim_{h \rightarrow 0} \frac{c - c}{h} \\ &= \lim_{h \rightarrow 0} 0 \\ &= 0 \end{aligned}$$

Therefore,  $f'(a) = 0$ .

### Question 3

Prove if  $f(x) = x$ , then  $\forall a : f'(a) = 1$ .

**Proof:**

Suppose  $a$  is any number, then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$ .

$$\begin{aligned} \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} &= \lim_{h \rightarrow 0} \frac{a+h-a}{h} \\ &= \lim_{h \rightarrow 0} \frac{h}{h} \\ &= \lim_{h \rightarrow 0} 1 \\ &= 1 \end{aligned}$$

Therefore,  $f'(a) = 0$ .

#### Question 4

Prove that if  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f(x) + g(x)$  is differentiable at  $a$  and  $(f+g)'(a) = f'(a) + g'(a)$ .

**Proof:**

Suppose  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$  and  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Thus,

$$\begin{aligned} f'(a) + g'(a) &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} + \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h} \\ &= \lim_{h \rightarrow 0} \left( \frac{f(a+h) - f(a)}{h} + \frac{g(a+h) - g(a)}{h} \right) \\ &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a) + g(a+h) - g(a)}{h} \\ &= \lim_{h \rightarrow 0} \frac{(f(a+h) + g(a+h)) - (f(a) + g(a))}{h} \\ &= \lim_{h \rightarrow 0} \frac{(f+g)(a+h) - (f+g)(a)}{h} \\ &= (f+g)'(a) \end{aligned}$$

Thus,  $(f+g)'(a) = f'(a) + g'(a)$ .

#### Question 5

Prove that if  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f(x) \cdot g(x)$  is differentiable at  $a$  and  $(f \cdot g)'(a) = f'(a) \cdot g(a) + f(a) \cdot g'(a)$ .

**Proof:**

Suppose  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$  and  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ .

$\lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Also, we know both  $f(a)$  and  $g(a)$  exist. Thus,

$$\begin{aligned}
(f \cdot g)'(a) &= \lim_{h \rightarrow 0} \frac{(f \cdot g)(a+h) - (f \cdot g)(a)}{h} \\
&= \lim_{h \rightarrow 0} \frac{(f(a+h)g(a+h) - f(a)g(a))}{h} \\
&= \lim_{h \rightarrow 0} \frac{(f(a+h)g(a+h) - f(a)g(a+h) + f(a)g(a+h) - f(a)g(a))}{h} \\
&= \lim_{h \rightarrow 0} \frac{((f(a+h) - f(a))g(a+h) + f(a)(g(a+h) - g(a)))}{h} \\
&= \lim_{h \rightarrow 0} \frac{((f(a+h) - f(a))g(a+h))}{h} + \lim_{h \rightarrow 0} \frac{f(a)(g(a+h) - g(a))}{h} \\
&= \lim_{h \rightarrow 0} \frac{((f(a+h) - f(a)))}{h} \cdot \lim_{h \rightarrow 0} g(a+h) + \lim_{h \rightarrow 0} \frac{(g(a+h) - g(a))}{h} \cdot \lim_{h \rightarrow 0} f(a) \\
&= f'(a) \cdot \lim_{h \rightarrow 0} g(a+h) + g'(a) \cdot \lim_{h \rightarrow 0} f(a)
\end{aligned}$$

By the theorem from Chapter 5 Question 9, we know that  $\lim_{h \rightarrow 0} g(a+h) = \lim_{x \rightarrow a} g(x)$ . Also, because this function is differentiable at  $a$ . Thus, this function is continuous at  $a$ , meaning  $\lim_{x \rightarrow a} g(x) = g(a)$ . Therefore,

$$\begin{aligned}
&f'(a) \cdot \lim_{h \rightarrow 0} g(a+h) + g'(a) \cdot \lim_{h \rightarrow 0} f(a) \\
&= f'(a) \cdot g(a) + g'(a) \cdot f(a)
\end{aligned}$$

Thus,  $(f \cdot g)'(a) = f'(a) \cdot g(a) + g'(a) \cdot f(a)$ .

**Question 6**

Prove that if  $f(x) : \mathbb{R} \rightarrow \mathbb{R}$  is differentiable at  $a \in \mathbb{R}$  and  $c \in \mathbb{R}$ , then  $g(x) = c \cdot f(x)$  is differentiable at  $a$ , and  $g'(x) = c \cdot f'(x)$ .

**Proof:**

Suppose  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$  and  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Also, we know both  $f(a)$  and  $g(a)$  exist. Thus,

$$\begin{aligned} g'(a) &= \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h} \\ &= \lim_{h \rightarrow 0} \frac{c \cdot f(a+h) - c \cdot f(a)}{h} \\ &= c \cdot \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} \\ &= c \cdot f'(a) \end{aligned}$$

Therefore,  $g'(x) = c \cdot f'(x)$ .

**Question 7**

Prove that if  $\forall x \in \mathbb{R}, n \in \mathbb{N}, f(x) : \mathbb{R} \rightarrow \mathbb{R}, f(x) = x^n$ , such that, if  $f(x)$  is differentiable at  $a \in \mathbb{R}$ , then  $f'(x) = na^{n-1}$ .

**Proof:**

Suppose  $n = 1$ , then  $f(x) = x$  and  $f'(x) = 1 \cdot a^{1-1} = 1$ , according to the assumption. Then we have,

$$\begin{aligned} f'(x) &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} \\ &= \lim_{h \rightarrow 0} \frac{a+h-a}{h} \\ &= \lim_{h \rightarrow 0} \frac{h}{h} \\ &= \lim_{h \rightarrow 0} 1 \\ &= 1 \end{aligned}$$

Thus, we have  $f'(x)$  as the assumption.

Suppose there is a  $k, k \in \mathbb{N}$ , such that  $h(x) = x^k$  and  $h'(k) = ka^{k-1}$ .

For  $k+1$ ,  $f(x) = x^{k+1}$ . Then, we have based on the definition of a derivative:

$$\begin{aligned}
f'(x) &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} \\
&= \lim_{h \rightarrow 0} \frac{(a+h)^{k+1} - a^{k+1}}{h} \\
&= \lim_{h \rightarrow 0} \frac{(a+h)^k \cdot (a+h) - a^k \cdot a}{h} \\
&= \lim_{h \rightarrow 0} \frac{(a+h)^k \cdot a + (a+h)^k \cdot h - a^k \cdot a}{h} \\
&= \lim_{h \rightarrow 0} \frac{((a+h)^k - a^k) \cdot a + (a+h)^k \cdot h}{h} \\
&= \lim_{h \rightarrow 0} \left( \frac{((a+h)^k - a^k) \cdot a}{h} + \frac{(a+h)^k \cdot h}{h} \right) \\
&= \lim_{h \rightarrow 0} \frac{((a+h)^k - a^k) \cdot a}{h} + \lim_{h \rightarrow 0} \frac{(a+h)^k \cdot h}{h} \\
&= a \cdot \lim_{h \rightarrow 0} \frac{((a+h)^k - a^k)}{h} + \lim_{h \rightarrow 0} (a+h)^k \\
&= a \cdot h'(x) + a^k \\
&= a \cdot k a^{k-1} + a^k \\
&= (k+1) \cdot a^k
\end{aligned}$$

Therefore,  $f'(a) = n a^{n-1}$  when  $f(a) = a^n$ .

### Question 8

Prove that if  $g(x)$  is differentiable at  $a \in \mathbb{R}$ , and  $g(a) \neq 0$ , then the function  $\frac{1}{g(x)}$  is differentiable at  $a$ , and  $\frac{1}{g(a)} = \frac{-g'(a)}{(g(a))^2}$ .

**Proof:**

Suppose  $g(x)$  is differentiable at  $a$ , then  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Let  $f(x) = \frac{1}{g(x)}$ , since we only know that  $g(a) \neq 0$ , but we can find a  $\delta$  such that  $\delta > |h|$  and  $g(a+h) \neq 0$ .

Then we have,

$$\begin{aligned}
f'(x) &= \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h} \\
&= \lim_{h \rightarrow 0} \frac{\frac{1}{g(a+h)} - \frac{1}{g'(a)}}{h} \\
&= \lim_{h \rightarrow 0} \frac{g(a) - g(a+h)}{h \cdot g(a) \cdot g(a+h)} \\
&= \lim_{h \rightarrow 0} \left( \frac{g(a) - g(a+h)}{h} \cdot \frac{1}{g(a) \cdot g(a+h)} \right) \\
&= \lim_{h \rightarrow 0} \left( \frac{g(a) - g(a+h)}{h} \cdot \lim_{h \rightarrow 0} \frac{1}{g(a) \cdot g(a+h)} \right) \\
&= -g'(a) \cdot \frac{1}{g(a) \cdot g(a)} \\
&= -\frac{g'(a)}{(g(a))^2}
\end{aligned}$$

Therefore,  $\frac{1}{g(x)}$  exist.

### Question 9

Prove that if  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $\frac{f}{g}(x)$  is differentiable at  $a$  and

$$\left(\frac{f}{g}\right)'(a) = \frac{f'(a) \cdot g(a) - f(a) \cdot g'(a)}{(g(a))^2}.$$

Suppose  $f(x)$  and  $g(x)$  are differentiable at  $a$ , then  $f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$  and  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Then, let  $h(x) = \frac{1}{g(x)}$ . Therefore,  $h'(x) = -\frac{g'(a)}{(g(a))^2}$ . Thus, we have  $\frac{f}{g}(x) = f(x) \cdot h(x)$ . Then,

$$\begin{aligned}
\left(\frac{f}{g}\right)'(a) &= (f \cdot h)'(a) \\
&= f(a) \cdot h'(a) + f'(a) \cdot h(a) \\
&= f(a) \cdot \left(-\frac{g'(a)}{(g(a))^2}\right) + f'(a) \cdot \frac{1}{g(a)} \\
&= \frac{-f(a)g'(a)}{(g(a))^2} + \frac{f'(a)}{g(a)} \\
&= \frac{f'(a) \cdot g(a) - f(a) \cdot g'(a)}{(g(a))^2}
\end{aligned}$$

Therefore, the derivative exist.

### Question 10

Prove that if  $g(x) : \mathbb{R} \rightarrow \mathbb{R}$  is differentiable at  $a, a \in \mathbb{R}$ , and if  $f(x) : \mathbb{R} \rightarrow \mathbb{R}$  is differentiable at  $g(a)$ , then  $f \circ g$  is also differentiable at  $a$ , and  $(f \circ g)'(a) = f'(g(a)) \cdot g'(a)$ .

**Proof:**

Suppose  $g(x)$  is differentiable at  $a$ , and  $f(x)$  is differentiable at  $g(a)$ . Then, we have  $g'(a) = \lim_{h \rightarrow 0} \frac{g(a+h) - g(a)}{h}$ . Then,

$$(f \circ g)(a) = \lim_{h \rightarrow 0} \frac{f(g(a+h)) - f(g(a))}{h}$$

Let  $l = g(a)$ ,  $m = g(a+h)$ ,  $t = l - m$  and  $l = m + t$ , where  $l - m$  is a very small increment. Thus, we have

$$\begin{aligned}(f \circ g)(a) &= \lim_{t \rightarrow 0} \frac{f(m+t) - f(m)}{t} \\ &= \lim_{h \rightarrow 0} \frac{f(m+t) - f(m)}{t} \cdot \frac{t}{h} \\ &= \lim_{t \rightarrow 0} \frac{f(m+t) - f(m)}{t} \cdot \lim_{h \rightarrow 0} \frac{t}{h}\end{aligned}$$
